

# QA Testing Defect Report

Tester Name: Bhoomi Sapke  
Date: 25-06-2026  
Project: Automatic Task Scheduler

---

## **DEFECT 1**

**Title:** Task Name Validation Too Strict

Description:  
The system accepts only alphabetic task names.

Steps:

1. Select Create Task.
2. Enter the task name "hospital\_appointment".

Expected Result:  
Task names with spaces, numbers, or underscores should be accepted.

Actual Result:  
System displays "Task contain only alphabet".

---

## **DEFECT 2**

**Title:** Priority Validation Issue

Description:  
The application accepts "High", "medium", and "low" only.

Steps:

1. Create a task.
2. Enter priority as "Medium" or "Low".

Expected Result:

Priority should accept High, Medium, and Low.

Actual Result:

Input is rejected.

---

### **DEFECT 3**

**Title:** Incorrect Time Validation and Lack of AM/PM Support

Description:

The application incorrectly rejects valid future times when creating a task. During testing, the current system time was approximately 03:03 PM. A task was created using today's date (25-06-2026) and a future time of 05:00 PM. However, the application displayed the message "Past date/time not allowed!" and did not allow the task to be created.

Additionally, the application accepts only 24-hour time format and does not clearly support AM/PM input. This may cause confusion for users because entering times such as "5:00" can be interpreted incorrectly. The system should either support AM/PM format or clearly indicate that only 24-hour format is accepted.

Steps :

1. Select "Create Task".
2. Enter a valid task name.
3. Enter today's date.
4. Enter a future time (for example, 05:00 PM).
5. Submit the task.

Expected Result:

The application should accept any valid future date and time and create the task successfully.

Actual Result:

The application displays "Past date/time not allowed!" even when a future time is entered.

---

### **DEFECT 4**

**Title:** Duplicate Task ID Generation

Description:

After deleting a task, a new task may receive an existing ID.

Expected Result:  
Each task should have a unique ID.

Actual Result:  
Duplicate IDs may be generated.

---

## **DEFECT 5**

**Title:** No Validation During Task Update

Description:  
Invalid dates, times, and priorities can be entered during task updates.

---

## **DEFECT 6**

**Title:** Completed Task Can Be Marked Completed Again

Steps:

1. Mark a task as completed.
2. Select Mark Completed again.
3. Enter the same Task ID.

Expected Result:  
System should display "Task already completed".

Actual Result:  
System again displays "Task Marked Completed".

---

## **DEFECT 7**

**Title:** Duplicate History Entries

Description:  
Repeated completion of the same task creates duplicate entries in the history file.

---

## DEFECT 8

**Title:** No Message When Status Search Returns No Records

Expected Result:

System should display "No Tasks Found".

Actual Result:

Nothing is displayed.

---

## DEFECT 9

**Title:** History File Has No Header

Description:

History records are stored without column headers.

---

## DEFECT 10

**Title:**Unused Import Statement

Description:

The "time" module is imported but not used.

---

## DEFECT 11

**Title:** Duplicate Task Names Are Allowed

Description:

The application allows multiple tasks to be created with the same task name without any warning or validation.

Steps to Reproduce:

1. Create a task with the name "Meeting".
2. Create another task with the same name "Meeting".

Expected Result:

System should either prevent duplicate task names or notify the user that a task with the same name already exists.

Actual Result:

Multiple tasks with identical names are created successfully.

Severity: Low

---

## **DEFECT 12**

**Title:** No Validation for Excessively Long Task Names

Description:

The application accepts very long task names without any length restriction.

Steps to Reproduce:

1. Select Create Task.
2. Enter a task name containing more than 100 characters.
3. Complete task creation.

Expected Result:

The system should validate task name length and display an appropriate message if the limit is exceeded.

Actual Result:

The task is accepted without any validation.

---

## **TESTING NOTE**

Notification functionality was not tested because the feature is currently not implemented in the application as informed by the developer.
